

Weapon Controls

Eurocontrol, since 1970, provides **control systems for weapons**, mainly for naval and also for avionic applications. Usually the system is composed by special **electric motors**, **control and power units**, **HMI**, **optical sensors**, **attitude reference units**, with **ballistic calculation** and **tracking of the target features**.

The systems have different communication interfaces, i.e. remote control, local control and FCS of the ship.
